SEEDS

Our Beautiful STATE

*I*n dedicating this first page of this and subsequent issues of our Spring Catalog to the presentation of the great number of beautiful homes and grounds that add so much to the glorious natural beauty of North Carolina, it is only fitting that we begin with these two familiar scenes. The State Capitol and grounds above and the Governor's Mansion below. Both of these fine lawns were grown from Wyatt's lawn grass seeds.

PRICES SUBJECT TO CHANGE

This catalog is printed in November and the market on many items of garden and field seeds has not yet been established. Consequently prices on those items indicate value at the time these pages are printed. Orders will be filled, if at all possible—at prices printed in this book, but ALL PRICES ARE SUBJECT TO CHANGE WITHOUT NOTICE.

What is meant by "TESTED SEEDS" ?

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

NON-WARRANTY

Owing to the many conditions beyond our control which might affect the germination and crop, and in accordance with the universal custom of the seed trade, Job P. Wyatt & Sons Co., gives no warranty, expressed or implied, as to description, quality, productiveness or any other matter, of seeds, bulbs or plants it sends out, and will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms they are at once to be returned. This does not mean that we lack confidence in the seeds we sell, but we have no control over the seeds after they leave our possession, especially as to methods of planting, cultivating and fertilizing, all of which are important factors in the success of any crop. Crops are dependent for success or failure on so many things besides seed that it is impossible for us to give any warranty or guarantee.

PLANT ORDERS

All orders for plants, such as Cabbage, Beets, Lettuce, Onions, Strawberry, Asparagus and Rhubarb Roots, also Baby Chicks, are shipped from our Grower's station and entirely separate from seeds and bulb orders. If you order seeds and also plants you will receive the seeds by return mail and the plants will be forwarded to you separately within a few days, weather permitting.

57 YEARS EXPERIENCE

For over a half century the Job P. Wyatt & Sons Company has served thousands of friends and customers throughout the entire South. Fifty-seven years of service means more than mere proof of our ability to serve—it means that we have had 57 years of experience in selecting strains and varieties best adapted to the conditions of the South. This year we offer again seeds that are the Standard of Quality and varieties that represent the very latest improvements.

VEGETABLE PLANTING CALENDAR

The chart below lists the more popular vegetables showing approximate dates, space for sowing, depth, etc. The dates for sowing and maturing would, of course, vary with the locality and the depth for sowing varies with soil consistency. The chart should be used as a general guide. We invite correspondence at all times relative to gardening or farming activities and are always glad to furnish any information that may be in our possession.

Auxilin Increases Propagating Profits— Adds to Gardening Pleasures

brids, camellia, cherry, daphne, holly, hornbeam, lilac, orange, rhododendron, rose hybrids, spruce and yew species.

The usual rooting time with Japanese Yew has been nine or more months with a high percentage of failure. With Auxilin treatment, Yew tree cuttings root six to twelve weeks with the percentage of successful rootings often exceeding 80 per cent.

The rooting time on Colorado blue spruce, usually propagated by uncertain and costly grafts, can be greatly shortened and a high percentage of rooted cuttings obtained.

Easy to Use

No special skill, no special apparatus is needed to obtain these outstanding results. To treat cuttings with Auxilin is as simple as immersing a finger in a glass of water. Indeed the technique is as simple as that. Simply mix Auxilin with water in varying quantities according to the species of plant (as explained in the directions) then immerse the basal ends of the cuttings in the water solution for a specified time. Any kind of clean water is suitable. Planting is then done in the usual manner.

Quicker Rooting

Auxilin stimulates the normal root growing function of cuttings and induces them to strike in much shorter time. This acceleration of rooting time applies to most commercial and ornamental varieties and species of perennials and hybrids.

Larger, Sturdier Roots

Cuttings properly treated with Auxilin develop larger, sturdier and more numerous roots over a wider area of the stem tissue, as well as at the base, than untreated ones.

Untreated Japanese Yew cuttings will usually develop only three or four spindly roots. Auxilin treated cuttings will develop from 10 to 15 larger, more vigorous roots.

Auxilin treated rose cuttings will usually develop 75 to 80 vigorous roots in two or three weeks, particularly the hybrid roses which are ordinarily slow and difficult to root.

Healthier Plants

Callus forms quickly on Auxilin treated cuttings but not in an excessive amount. This rapid formation, in addition to the rapid root growth, tends to increase resistance to certain plant diseases which cause heavy losses under the old methods. On Auxilin treated geraniums, for example, losses due to black rot are usually reduced to a very low point because of the rapid callusing and vigorous root growth. Die back, another common cutting bench disease, is similarly resisted by Auxilin treated cuttings.

Quicker Growth—Earlier Maturity

Auxilin treated cuttings generally produce rapid and vigorously growing plants. Cuttings taken from woody or perennial plants and treated usually produce stronger and more uniform specimens. With evergreens, as for example new growth will follow the same year after the cuttings have rooted. Cuttings with flower buds on them will usually bloom the same season and generally produce a greater number of larger blooms. Cuttings thus treated mature sooner and flower earlier than those grown from seed.

When to Treat

Cuttings or slips of most plant species root well at any time of the year when Auxilin treated, but best results by the

non-commercial grower are usually obtained during the normal outdoor growing months with softwood (immature) leafy cuttings. The use of Auxilin greatly lengthens the time in which cuttings can be successfully rooted; as for example, Lilacs, if Auxilin treated, can be rooted in July. If rooted outside of their normal growing season, protection against adverse weather should be given.

Economical to Use

Auxilin offers economy to the commercial grower, not only in the low purchase price and infinitesimal cost per cutting, but in its proven ability to reduce propagating losses and to save time, labor and bench space in the propagating house. It eliminates much of the costly hazard from propagating cuttings and its general use is fast becoming the accepted standard practice in the florist and nursery trade.

To the non-commercial grower, Auxilin offers the opportunity of increasing gardening pleasure with the certainty of the most satisfying results. It is simple to use, inexpensive and "a little goes a long way".

Indolebutyric Acid

Commercial growers who prefer to use the crystalline form of Indolebutyric acid, rather than Auxilin, the solution form, are invited to inquire for prices.

Users Report Splendid Results

"Splendid Results"

A Michigan grower, specializing in delphiniums, phlox, oriental poppy and iris, in his repeat order for Auxilin, reported he had splendid results from his trial order.

"Cuts Rooting Time"

Here is a portion of a letter received from a Maryland nurseryman: "Already this summer I have rooted Dianthus in less than 2 weeks, Chrysanthemums, 2½ weeks; Geraniums 2 weeks; Honeysuckle, 3 weeks; Hydrangea Peegee, only 2½ weeks; Lavender, 2 weeks; Rose—Dr. Van Freer in 2½ weeks; Hardy Phlox, 3 weeks; African violets, 3 weeks; and other varieties".

"Decided Gain in Production"

Read what this Western greenhouse man has to say about Auxilin: "Trials last month (August) and late July using your Auxilin treatment on both Geranium and Petunia cuttings demonstrates that a decided gain in production as well as a desirable shortening of time in the propagating bed is gained through its use. We are making it a regular part of our routine in the propagation of these subjects and will expand these trials to other items as rapidly as the season permits".

"Will Make Us Many Dollars"

From Oregon comes this enthusiastic letter from a commercial grower reporting on Auxilin with cuttings: "The untreated cuttings had been in the sand two weeks and the loss on this lot was about 50% under present conditions. The Auxilin treated cuttings had been in 5 days and the roots were equal to that of the other lot while the loss will probably be no more than 2%".

"As this stock is most valuable . . . this increased strike with shorter rooting time now during the novelty period when production is limited means that Auxilin will make us many dollars on this item alone".

How Science Improves on Nature

FOR over half a century, brilliant scientists have been trying to improve on Nature's slow way of propagating "slips" or plant cuttings. Back in 1882, Julius Sachs of the Botanical Gardens in Java advanced the theory that a specific chemical controlled the rooting process.

Scientists later identified the chemical and found it to be located in the growing tips of plant leaves and buds. Its use in minute quantities resulted in root growth. Because of this, the chemical was named "Auxin" from a Greek word meaning "to grow".

Through careful work by distinguished botanists and plant physiologists in the United States and elsewhere, other important discoveries were made. Another substance was found in animals to have auxin-like effects when applied to plants. This was named "hetero-auxin". Then other workers discovered a method of producing Indolebutyric acid, a hetero-auxin more stimulative to root growth than the natural auxins found in plants.

Auxilin—A Scientific Development

Auxilin is a solution of Indolebutyric acid in a ready-to-use solution which has practical advantages for professional growers and gardeners. It represents the most advanced findings of research workers in the field of plant "hormones". Auxilin induces and stimulates rapid root growth, but is not intended to and cannot take the place of fertilizer. It is not a plant food and will not restore life and vitality to dead plant tissue.

Auxilin Ends Uncertainty

The old, slow, uncertain, wasteful methods of plant propagation are now outmoded. With Auxilin, professional propagators and commercial growers can speed up production,

reduce costs and increase profits. With Auxilin, gardeners can generally secure results which no commercial grower, planting untreated cuttings, can hope to obtain, even under ideal greenhouse conditions.

How Auxilin Acts

The exact action of Indolebutyric acid, the principal ingredient in Auxilin, in making cuttings root is unknown. But the results are definitely visible, definitely provable and most any grower can obtain them. Properly applied to cuttings, Auxilin induces roots to form; not thin, weak roots, but strong, sturdy, healthy, non-brittle ones—*many of them*.

Most Plants Respond

Generally, it is a fact that most plant species will respond to Auxilin treatment. Successful rooting has been obtained on the following representative but partial list of plants. Thus the plants mentioned below, considered in time past to be hard to propagate, not only do so when Auxilin treated, but do so in a relatively short time.

Use Auxilin-Save Time, Money and Plant Losses

General Directions for Use

Detailed directions will be found in every package of Auxilin. The convenient Auxilin measuring vial and directions will enable growers to supplement the Auxilin directions for those issued from time to time by state and federal agricultural experiment stations.

Select vigorous wood. Make cuttings two to six inches long. It is not necessary to make a slanting cut or a cut below a bud, node or leaf in treating with Auxilin. Keep cuttings fresh. Make Auxilin-water-solution, following chart in directions. Place cuttings in solution for

time suggested. Follow usual methods after treatment. Transplant when adequate roots are formed.

No. 17 Bean Wyatt's Bountiful

Bean Culture—Beans are sensitive to both cold and wet, so do not plant till the ground is warm. To have a continuous supply plant every two weeks till the middle of August; farther South they may be planted even later. Make the rows 2 to 3 feet apart, drop the beans 8 inches apart and cover $1\frac{1}{2}$ to 2 inches deep. Give frequent but shallow cultivation up to blossoming time, not afterward and never when the plants are wet. Plant in a light loamy soil that warms up quickly. The head is a compact cluster of tightly closed flower buds and resembles cauliflower only in shape. When the central head is cut, numerous sprouts develop from the leaf axes, each sprout terminating in small green separate heads. These are cut in lengths of 10 to 12 inches and tied in bunches of 2 or 3 for a second crop. Served in the same way as asparagus, they form a very tasty and nourishing dish. 90 days. Prices: Pkt. 10c; 1 oz. 25c; ¼ lb. 75c; lb. \$2.75; 5 lbs. \$12.50, postpaid.

WYATT'S CABBAGE SEEDS

Days indicated represent time from setting plants to heading

CULTURE—If the plants are started in a seed-bed, they should not be crowded or they will run up weak and slender and will not endure transplanting well. When 4 to 6 inches high, transplant to open field, setting the plants as deep as the first leaf stems; give frequent and deep cultivation, drawing the earth to the plants at each working. Set the early varieties 18 inches apart in rows 2½ feet; the larger and later sorts, 2 feet apart in 3-foot rows. They need a light and well watered soil, rich in nitrogen. One ounce will produce about 1,500 plants; ½ lb. will produce sufficient plants to set an acre. Thousands of successful growers depend on Wyatt's Tested Cabbage Seed. Be sure to plant the best seed from Wyatt's.

WYATT'S CARROTS

ONE OF THE MOST WHOLESOME VEGETABLES
CULTIVATED — AND A SURE CROP

CULTURE—One ounce of seed for 100 feet drill, 3 to 4 pounds per acre. For several generations the carrot has been one of the common garden vegetables but only in recent years has it come to be recognized as one of our most nutritious and wholesome foods. Health authorities assert that carrots contain in high degree those elements which constitute a nourishing article of diet. The plant has no serious insect enemies and is rarely subject to disease. The culture of carrots is easy, being practically the same as that of beets. When practicable it is best to plant them in soil that has been richly fertilized the previous season. Freshly manured soil will often produce divided roots. Plant the seed $\frac{1}{2}$ inch deep in loose, well prepared soil, making rows 16 to 24 inches apart. Cultivate as soon as the plants are well established and thin to 2 to 4 inches in the row, according to the size of the variety. Plantings may be made from early spring until mid-June and again in the early fall.

No. 183—Chantenay—A half-long variety most extensively used for both home garden and market. It is a medium early variety and matures in about 65 days, besides it is very productive. It is a medium early variety, half-long, smooth, blunt-rooted sort. The color is deep orange and the flavor is delicious. 68 days. Prices: Pkt. 5c; oz. 10c; $\frac{1}{4}$ lb. 25c; lb. 75c; 5 lbs. \$3.00, postpaid.

No. 185—Danvers Half-Long—This fine half-long variety commands approval wherever planted. It has a handsome orange red color and the smooth roots taper to a blunt point. Prices: Pkt. 5c; oz. 10c; $\frac{1}{4}$ lb. 25c; lb. 75c; 5 lbs. \$2.90, postpaid.

No. 188—Scarlet Nantes Coreless—A very superior early table carrot and because of the delicate texture of the roots has been named "Coreless." They are very uniform in shape and size, 6 to 7 inches long, by $1\frac{1}{4}$ inches through; clean skinned, smooth and the color is a rich red orange, so attractive when served. 65 days. WYATT'S CAULIFLOWER

Wyatt's Snowball Cauliflower No. 191

One ounce of seed will produce 1,500 plants, $\frac{1}{2}$ pound sufficient for an acre.

CULTURE—Cauliflower will do well in any land that is suitable for cabbage, and in general the same cultural directions apply as for cabbage. Plenty of moisture is necessary for their development, especially at heading time. Sow seed in hotbed in November, transplant into cold frame for protection during the winter, and set out in the fields early in April, in rows 2 to $2\frac{1}{2}$ feet apart, and 18 to 24 inches apart in the row. For late crop, sow seed about the 15th of April, transplanting when plants are large enough. Cultivate like cabbage. When the head commences to form, draw the outside leaves over the head to protect from the sunlight, thus keeping it white.

WYATT'S ROASTING EAR AND SUGAR CORNS

One pound will plant about 200 hills;
12 pounds will plant an acre

CULTURE—Plant 5 or 6 grains, 1½ inches deep, 3 feet apart in rows 3 feet apart. When plants are 4 inches high pull out all but two plants to the hill. For very early Corn, the hardest and earliest varieties can be planted the latter part of March if the weather is mild, but Sweet Corn should not be planted until April, or until the Spring weather opens and the ground gets warm, as it has a tendency to rot in the ground if planted too early or during a continued cold or rainy spell of weather. It should be planted at intervals of every two weeks until August, so as to have Corn for use during the entire season.

WYATT'S KALE

Extra Dwarf Blue Curled Scotch Kale No. 342

CULTURE—1 ounce of either Green Curled or Spring Kale or 2 ounces of Scotch are sufficient for 100 feet of drill. For an acre, 1½ pounds of either Green Curled or Spring, and from 3 to 7 pounds of the Scotch. Scotch Kale being particularly subject to the attacks of insects, both before and after coming up, it is necessary to sow it very thickly. Scotch Kale should be sown from the first to the last of August, and the Green Curled from the middle of August until the first of October. Spring Kale is sown nearly all the year round, either in drills or broadcast, and should be sown at intervals of 10 days in order to always have it tender. Sow ¼ inch deep in rows 2½ feet apart, allowing from 6 to 10 inches between the plants, and cultivate as cabbage. Kale, being a very strong feeder, heavy manuring is necessary to make a good crop.

No. 342—Extra Dwarf Blue Curled Scotch—The plants of this splendid Kale grow low and compact and of a spreading habit. EGGPLANT

CULTURE—One of the most delicious vegetables grown, yet it is not cultivated to the extent it would be if its superior qualities were better known. Seed germinates slowly and should be started in hot-beds. When plants have two rough leaves transplant 3 to 4 inches apart. When the weather is sufficiently warm, set plants in open ground, allowing 3 feet space between rows, and 2½ feet space between the plants in the row. Hoe frequently, keeping the soil loose and fine. Earlier plantings may be made in open ground if protected by Hotkaps. One ounce will produce 1,000 plants; ¼ lb. will sow an acre.

No. 314—Black Beauty—The earliest and best of all large-fruited Egg plants. It is valuable alike to the private planter and the extensive grower for market. Black Beauty produces fruits fully as large and ready for use ten days to two weeks earlier than the New York Purple. The plants branch very freely near the ground and grow in well rounded bushes. The grand, large fruits are thick, of most attractive form. The skin is a rich, lustrous, purplish, black—the satin gloss and rich coloring adding greatly to its beauty. The intensely brilliant coloring is uniform over the whole fruit and does not fade or change to a lighter color. 120 days. WYATT'S FAR WESTERN GROWN CANTALOUPE

CULTURE—The Melon delights in warm rich soil with perfect drainage, and can never be grown to perfection under unfavorable conditions. Very good Melons, however, can be grown on almost any land if the trouble is taken to dig holes 2 feet square, filling them with a rich compost of woods-mould and cow-pen manure. Plant three-fourths to one inch deep from April to June in rows 6 feet apart, leaving not less than 4 feet between the hills, putting about

10 seeds to the hill. As insects are often very destructive, it is best not to thin at all until the plants are well started. When they are large enough to be safe, thin to two in a hill, and keep the ground mellow and free from weeds. Those who make a specialty of Muskmelons will find it advantageous to start the seed under protection of glass, so as to have the plants ready by the time seeds could be usually planted in the open ground.

WYATT'S PEPPERS

One Ounce of Seed Produces About 1,000 Plants

CULTURE—Sow the seed in hotbed or a window box at a temperature of about 70 degrees on or about February 15. Transplant to the open ground when all danger of frost is over, in rows 3 to 5 feet apart and plants set 15 to 20 inches apart in the row—about 9,000 plants are required to set an acre. Cultivate frequently and keep free from weeds. A mixture of sheep manure and chicken manure is most desirable for distributing in the rows a week or ten days before the plant is set out. When the plants are well set and started at about 7 inches high, guano or any well-rooted manure hoed into the surface soil will also increase plant growth and fruiting qualities. We are large growers of Pepper seed. Can supply large orders. The seed is grown from well selected and transplanted plants which show purity and excellent quality. All our Pepper seed are true American grown—we have no cheap pulp mill or imported stocks to offer.

Prices: Pkt. 10c; ½ oz. 20c; oz. 35c; ¼ lb. \$1.25; lb. \$4.25; 5 lbs. \$18.75, postpaid.

TOMATOES

All Treated With Semesan To Prevent Damping Off and Wilt

An Extra Service—No Extra Cost

CULTURE—1 ounce is sufficient for 100 feet of drill; 4 ounces will produce enough plants to set an acre. The tomato flourishes best in warm, light soil, moderately rich. For early use sow $\frac{1}{2}$ of an inch deep in January or February in a hot-bed, or, if only a few plants are wanted, they may be sown in a box. In order to get the plants strong and stocky, they should be transplanted when 2 to 3 inches high. When all danger of frost has passed set out in the open ground in rows 3 feet apart, leaving the same distance between the plants, and if convenient, furnish a support for the vine. For late crops sow in the open ground as above directed. Wyatt's Tomato Seeds are planted by many of the leading truckers in the South.

No. 745—New Break O' Day Tomato

Dept. of Agriculture, and is a cross between Marglobe and Marvana, having the disease-resistant qualities of its parents. Vine is of open habit similar to Marvana, but heavier in growth. Fruits are of the Marglobe type, deep, globe-shaped, solid, meaty, with few seeds, and a beautiful scarlet color. Excellent for home gardens, truck farmers, or canners. It is destined to be the "PEER" of early Tomatoes. 95 days. Prices: Pkt. 10c; $\frac{1}{2}$ oz. 20c; oz. 35c; $\frac{1}{4}$ lb. \$1.10; lb. \$3.75; 2 lbs. \$7.00; 5 lbs. \$15.00, postpaid.

HERBS FOR BEAUTY-FLAVOR-FRAGRANCE

In Cultivation Before the Christian Era, Herbs Form the Most Fascinating Group of Subjects in Modern Gardening*

For all-round interest most gardeners will admit that the versatility of the aromatic herbs make this group of plants among the most fascinating. A small assortment of herbs will furnish food, flavoring, medicine, fragrance in the garden and in the home, besides their beauty as garden subjects and cut flowers. Herbs thrive in most soils and should be sown early in the spring. Thin out to about one foot apart. Those grown for foliage should be cut before they come into full bloom and hung in bunches or spread thinly where they can dry quickly.

This fascinating study, one that was practised so diligently thousands of years ago—Herb gardening—is once more coming into popularity. Be the first to have a complete herb garden in your neighborhood. Our stock of herb seeds is one of the most complete in America.

We are also pleased to offer and recommend to our customers the two first ranking books on herbs. "The Herb Garden" by Frances A. Bardswell (\$3.00 postpaid) noted English authority and "Gardening with Herbs" by Helen Morgen-thau Fox (\$2.50 postpaid) eminent American author of garden subjects.

WYATT'S NASTURTIUMS

Few garden annuals respond to as little care as the Nasturtium. For ease of culture, duration of bloom, brilliance of coloring and general excellence, they are unexcelled. All they need is a moderately good soil, in a well-drained sunny position, and from within a few weeks from the time they are sown until frost comes there is an endless profusion of their gorgeous blossoms.

WYATT'S PETUNIAS

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

No. 1909 — Petunia, Burgundy—

Burgundy is one of those rugged individualists of the garden, a strong growing type, with very showy flowers in a shade of deep red which is rather difficult to combine with other colors. Since, however, its own color is so showy in itself, it is well worth growing as an accent or specimen group. The flowers which are plain edged, are of good size and substance, the strong red contrasting boldly with the snowy white throat. The plants make a heavy growth and are very free blooming. Pkt. 25c; 2 packets 40c.

Ⓜ No. 1907 — Petunia, Wyatt's Dainty Lady—

(See Illustration)—An exquisitely fringed graceful flower that introduces an entirely new color in Petunias. Dainty Lady is a delicate golden yellow. To perfect this lovely flower has required 10 years of careful hybridization and selection. Besides being an All American selection, Dainty Lady has also won an Award of Merit by the Royal Horticultural Society of England. Owing to the unusual demand and the extreme shortage of seeds last season many orders had to go unfilled. The supply of seeds should be sufficient this season, however we would suggest that all who intend growing this lovely petunia, send their order early. Pkt. 25c.

NO. 1930—GIANT DOUBLE FRINGED PETUNIAS MIXED—Seeds are very expensive. Produce about 60 per cent double flowers. Pkt. 50c; 2 pkts. 85c; 1-64 oz. \$7.50.

WYATT'S GIANT ORCHID FLOWERING SPENCER SWEET PEAS

WYATT'S SPENCER SWEET PEAS are produced for us under almost perfect growing conditions in the fertile Lompoc Valley in California. As is true of all other Wyatt's seeds, our special strain of Sweet Peas is the very best. Four tremendous ruffled flowers on long stems often 14 inches, clear refined colors and vigorous, long blooming plants are characteristics of all varieties of Wyatt's Sweet Peas.

CULTURE—One ounce will sow from 15 to 20 feet. Sow from November to March. For spring plantings we recommend the sowing of Sweet Pea seeds slightly below the ground level in a bed thoroughly pulverized 2 feet wide by 12 to 18 inches deep. Well rotted (but no other) compost or a liberal sprinkling of Bone Meal might be added when the bed is prepared and when the peas are growing slight applications of Bloomaid or Vigoro at 4- to 6-week intervals should be made.

Grow Your Own Perennials
From Seeds

Everybody wants Perennials—and wants them in generous measure to secure the desired effects in color and charm. If you delay and finally buy plants, the cost mounts high; an attractive perennial border may require several hundred dollars worth of plants. Exactly the same results can be secured with \$3.00 or \$4.00 worth of seeds! Aside from the money saved it is very fascinating to grow your own plants from seed.

WYATT'S LAWN GRASSES AND FERTILIZERS

HOW TO BUILD A LAWN

A scene at Montlawn—Raleigh's beautiful new cemetery on Highway 21

The first requisite for a lawn of any kind, be it permanent or merely temporary, is good soil. Good soil from a point of plant growth must have these three vital parts: Plant food, moisture, humus. Most of us are familiar with the first two of these but some of us are not so familiar with the third—humus. Humus is that part of an ideal soil that renders it porous and loamy. It prevents heavy soils from packing or baking and adds "body" to light or sandy soils, thereby increasing their moisture holding capacity. Therefore, since plant foods must be in a liquid form before they are available to plants, humus is the most important of the three vital parts of an ideal soil. Heavy soils without humus are so tightly packed that they have no room for moisture. Loose sandy or light soils, while having great capacity for moisture, drain so rapidly that they become very dry too often for healthy plant growth. And so we see then that humus added to heavy soil increases its capacity for moisture while preventing its packing or baking and when added to sandy or light soil increases its ability to retain moisture.

FIELD AND FARM SEEDS

RECLEANED CLOVER SEED

No. F97—Alfalfa, Kansas Grown—We offer nothing but the very finest grade of genuine Kansas Grown Alfalfa and our seed is usually 99 per cent or better pure Alfalfa. The hay is remarkably palatable and the feeding value worth nearly twice that of the very best Timothy. Droughts have no effect upon Alfalfa, as its roots penetrate to astonishing depths. Alfalfa can be sown in either fall or spring. The cleaner the ground, the better the stand will be. Sow on deep, well drained, good loamy land. Alfalfa will not grow on acid soils, and to correct this condition spread 1 to 1½ tons of finely ground lime to the acre after plowing and a few weeks before sowing. Cutting should be done always as blooming begins. Sow 30 to 40 lbs. to the acre. Prices: Lb. 50c; 5 lbs. \$2.40, postpaid. Not prepaid, 10 lbs. \$4.25; 25 lbs. \$10.50; 100 lbs. or more at 40c lb.

No. F87—White Blossom Sweet Clover—This is known as Melilotus Alba. It is adapted to a wide variety of soils: is used for pasture, for forage, for ensilage, for bees, for turning under to improve the land. The first season it grows 1½ to 2½ feet high, but if cut when 6 inches high it stools out and makes a more tender growth for grazing. Sow 20 lbs. per acre. Prices: Lb. 35c; 5 lbs. \$1.50, postpaid. Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 25 to 30 lbs per acre.

PRICES: KOBE—(recleaned)—Lb. 25c; 5 lbs. \$1.00, postpaid. Not prepaid, 10 lbs. \$1.10; 25 lbs. \$2.50; 100 lbs. or more at 9c lb.

No. F92—Korean Lespedeza—This popular new Japanese type clover is coming into large demand. Korean Lespedeza will grow on any soil, wet or dry, rich or poor, sour or sweet, and has never been killed by a drought. When a good crop of Korean Lespedeza is turned under it will double the corn yield in one year. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. A good stand will make one ton hay per acre for each 4 to 5 inches above cutter bar. The hay is easier to cure and handle than soy beans, red clover, or alfalfa. When cutting for hay cut in August or early September. If hay crop is to reseed the land, hay must be either early and high enough for stubble to make sufficient growth to produce seed; or wait until seed have formed on bottom branches, which seed shatters to the ground for reseeding. Korean Lespedeza is earlier than other lespedezas, this insures harvest before fall rains and early frost and gives time for seed bed preparation for small grain that fall. If a good stand is expected the first year sow from 20 to 25 pounds of seed per acre. Prices: Lb. 25c; 5 lbs. \$1.00, postpaid. Not prepaid, 10 lbs. \$1.10; 25 lbs. \$2.50; 100 lbs. or more at 8½c lb.

No. F91—Common Lespedeza or Japan Clover

It grows on galled hillsides and on all soils, even on the poorest, and being a legume will extract nitrogen from the atmosphere and store it in the roots for later crops. Its abundant long tap-roots and laterals, when decayed, open up the subsoil and leave in it great quantities of nitrogenous matter that will increase the yield of succeeding crops. Once started it soon spreads and takes possession. Sown on old pastures, it will add very materially to the value of the pasture. Sow 25 lbs. per acre. Prices: Lb. 35c; 5 lbs. \$1.10, postpaid. Not prepaid, 10 lbs. \$1.75; 25 lbs. \$4.00; 100 lbs. or more at 15c lb.

No. F94—Tennessee 76 Lespedeza

Tennessee 76 grows 12 to 24 inches high and is three weeks later than Common. The close resemblance in the seeds of these two varieties prompts us to urge all of our customers to use every care when buying Tennessee 76. Why not buy pure stock direct from Wyatt's? Then you'll know you've got the genuine Tennessee 76. Sow 25 to 30 lbs. per acre.

WYATT'S GRASS SEEDS FOR HAY AND PASTURE

Sudan Grass No. F73

No. F73—Sudan Grass—A wonderful quick growing summer hay crop. As big a yielder as Johnson grass, but it has none of the latter's objectionable features, for Sudan grass can never become a pest, as it is an annual. Its greatest value is for hay, which is well liked by stock. The hay is equal to timothy in feeding value. It is also strongly drought resistant. Sow it after the ground becomes thoroughly warm, either broadcast or in rows two feet apart, and cultivate like corn. When sown in rows it grows six to seven feet high; when sown broadcast it grows four to five feet high. Sudan grass may be profitably grown with cowpeas and soybeans, as being of erect growth it supports the pea vines and makes the cutting easier and allows them to cure more quickly; the mixture will give a better-balanced ration than either fed alone. When grown with cowpeas or soy beans make the sowing of Sudan grass after the peas or beans are planted and covered. Almost any soil, from heavy clay to light sand, will grow Sudan grass. Sow 5 to 6 lbs. to the acre in 2-foot rows; 20 to 25 lbs. broadcast. Prices: Lb. 20c; 5 lbs. 55c, postpaid. Not prepaid, 10 lbs. 75c; 25 lbs. \$1.50; 100 lbs. or more at 5c lb.

No. F43—Italian Rye Grass—American Grown—Highly recommended for hay crops on rich land. An annual grass with tall, broad flat leaves; very valuable for winter pastures, either alone or in mixtures. Sow 5 lbs. per 1,000 square feet for lawn; 30 to 40 lbs. per acre for pasture. Our seed is thoroughly re-cleaned and is 98 per cent pure or better. Prices: Lb. 25c; 5 lbs. 75c, postpaid. Not prepaid, 10 lbs. \$1.30; 25 lbs. \$3.00; 100 lbs. or more at 11c lb.

No. F42—English Rye Grass—It produces an abundance of foliage that remains bright and green throughout the season, will bear frequent and close cropping, is relished by all kinds of stock, and is not easily injured by tramping. It prefers a stiff wet soil. Prices: Lb. 35c; 5 lbs. \$1.50, postpaid. Not prepaid 10 lbs. \$2.50; 25 lbs. \$6.00; 100 lbs. or more at 22½c lb.

No. F48—Bermuda Grass—Makes a vigorous and persistent growth in every part of the South. Lasts for years; stands a long, hot summer without injury; grows well in any soil that is not too wet. Sow at the rate of 8 to 10 lbs. to the acre for pasture; 15 to 20 lbs. for lawns and golf courses. Plant from March until June. Seed will not germinate when ground is cold, and under favorable conditions, takes 30 to 40 days to germinate. Prices: Lb. 45c; 5 lbs. \$2.00, postpaid. Not prepaid, 10 lbs. \$3.30; 25 lbs. \$8.00; 100 lbs. or more at 30c lb.

No. F51—Carpet Grass—It is remarkable for its ability to grow on poor sandy soils, thriving far better than Bermuda grass; it thrives vigorously on any kind of soil if moisture conditions are favorable, even if the land is acid, and will furnish more grazing than Bermuda grass. Sow 10 lbs. per acre for pasture and 20 lbs. for lawns. Prices: Lb. 45c; 5 lbs. \$2.00, postpaid. Not prepaid, 10 lbs. \$3.30; 25 lbs. \$8.00; 100 lbs. or more at 30c lb.

No. F55—Timothy—A hay grass suitable only for the northern part of the south, especially hill and mountain districts. It is the standard hay crop of the North and makes one of the most popular, nutritious and salable of hay grasses. It does not make such good pasturage but the hay crop is great. Sow 15 lbs. per acre. Prices: Lb. 25c; 5 lbs. \$1.00, postpaid. Not prepaid, 10 lbs. \$1.25; 25 lbs. \$2.75; 100 lbs. or more at 10c lb.

No. F47—Orchard Grass—One of our most reliable grasses for the Middle South for hay and pasture. While succeeding well in almost all fertile soils it does best on loamy and moderately stiff uplands. Starts growth very early in the spring and continues well into the winter. It is very easily handled and cured for hay. It is a long-lived grass, with half a chance lasting under good treatment about thirty or forty years; yet it is easily exterminated if the land is wanted for other purposes. No. F194—Wyatt's Sugar Drip Cane—No new sorghum has been brought out that can compare with it in yield of syrup. It makes a large, juicy and succulent growth. It will yield about 65 per cent of the weight of the cane in juice when extracted by a good farm mill; a stronger mill should extract as much as 75 to 80 per cent. **Prices:** Lb. 25c; 2 lbs. 40c; 5 lbs. 65c, postpaid. If grown with cowpeas or soy beans the quality of the hay is improved and a more nearly balanced ration may be had. The proportions recommended are 15 lbs. Early Amber Cane, ½ bushel of soy beans and 1 bushel cowpeas to the acre broadcast. Grows 10 to 12 feet high. Sow broadcast 1 to 1½ bushels to the acre; 5 to 6 lbs. plants an acre in 3½- to 4-foot rows. **Prices:** Lb. 25c; 2 lbs. 40c; 5 lbs. 65c, postpaid. When grown for grain, the tops are cut, cured in a dry place and threshed like other grains. For cattle, horses, hogs, and poultry, the grain may be fed either whole or ground. It is of high feeding value, and will take the place of corn. Plant 8 to 10 lbs. to the acre in rows 3½ to 4 feet apart. Sow broadcast at the rate of 25 lbs. per acre. **Prices:** Lb. 30c; 5 lbs. \$1.00, postpaid. Not prepaid, 10 lbs. \$1.50; 25 lbs. \$3.50; 100 lbs. or more at 13c lb.

Not prepaid, 10 lbs. \$1.50; 25 lbs. \$3.25; 100 lbs. or more at 12c lb.

No. F289—Teosinte—A single seed producing from thirty to sixty stalks, each 10 to 12 feet high, gives some idea of what an enormous yield may be had from Teosinte—the Louisiana Experiment Station reported a crop of more than 50 tons on an acre. If cut when 4 or 5 feet high, it makes an excellent fodder, starts immediately into growth again, and will give several more cuttings as large as the first. If sufficient is planted a continuous supply of nutritious green feed can be had daily right up to frost. Plant in May or June in drills 3½ to 4 feet apart; 3 to 4 lbs. plants an acre. **Prices:** ¼ lb. 15c; lb. 50c; 2 lbs. 90c; 5 lbs. \$2.10; 10 lbs. \$3.95, postpaid. Not prepaid, 10 lbs. \$3.50.

Seed thickly, not less than 50 lbs. to the acre, any time from the middle of April until the end of July. It's a quick crop, maturing in six to eight weeks. Cut while in bloom, before the seed hardens in the head. Growing millet with an early variety of cowpeas, like Whippoorwill, is becoming quite popular, 40 lbs. of millet being sown with a bushel of cowpeas. The crop should be cut when the millet is coming into bloom, regardless of the maturity of the cowpeas, for at that stage the feeding value of the millet hay is the highest. **Prices:** Lb. 25c; 5 lbs. 75c, postpaid. Not prepaid, 10 lbs. \$1.00; 25 lbs. \$2.00; 100 lbs. or more at 7½c lb.

It does well even on poor land, and surprisingly well in dry seasons. All kinds of stock eat it greedily. Should not be planted until the ground is thoroughly warmed. Sow 6 to 8 lbs. to the acre in rows 3 feet apart. **Prices:** Lb. 30c; 5 lbs. 90c, postpaid. Not prepaid, 10 lbs. \$1.10; 25 lbs. \$2.50; 100 lbs. or more at 9c lb.

When green, feed a moderate quantity at first, gradually increasing the quantity as the animals become accustomed to it. **Prices:** Lb. 25c; 5 lbs. 85c, postpaid. Not prepaid, 10 lbs. 80c; 25 lbs. \$1.75; 100 lbs. or more at 6c lb.

WYATT'S TREATED and TESTED TOBACCO SEED

ARE TREATED TO PREVENT WILDFIRE, BLACK FIRE, ANGULAR LEAF SPOT AND OTHER TOBACCO DISEASES.

CULTURE—A very clean piece of land is best for the tobacco plant beds, hence it is customary to burn a piece of land in the woods for plant beds. When large enough and weather is settled (about May), set the plants out in highly manured or fertilized soil in 3½ foot rows, 3 feet between the plants.

WYATT'S N. C. CERTIFIED TOBACCO SEEDS

There is no reasonable argument against the use of Hyatt's North Carolina State Certified Tobacco Seeds when it is taken into consideration that one ounce of Certified seeds will produce enough strong healthy plants to set from one to three acres, and that the seeds have been harvested from only those plants that measure up in every way to the very highest standard set by the North Carolina Crop Improvement Association. The North Carolina Crop Improvement Association has carefully inspected the growing of the crops and the seeds have been tested for 1937. Prices: Oz. \$1.00; 3 ozs. \$2.50, Postpaid.

WYATT'S BLOOD TESTED BABY CHICKS

100% LIVE DELIVERY GUARANTEED—POSTPAID

You are guaranteed 100 per cent live delivery of chicks from us, so with a good brooder and house 500 or more may be purchased and cared for, fed and reared with much less expenditure of time and money than was required with one-half that number under the old method. You can get your chicks early and raise early pullets that will begin laying in the early fall and continue through the winter, when eggs are high. Your broilers may be sold on an early market when the price is always high.

HOW TO ORDER

To avoid any delay, use the order blank. Orders are filled in turn, so book your's in advance, if possible. State second and third choice if you can use other breeds.

Straight orders of one kind are best. Do not order too many different kinds at one time. We do not always have chicks of every breed hatching and this may delay your order. Do not wait until a week before you are ready for the chicks and expect to receive them by return mail, for the wise poultryman has placed his order weeks in advance and is likely to be getting them the same day you want them.

TERMS

Our terms are cash with order. We will book orders with a 25 per cent cash deposit, balance on remittance to be made when we notify you. No chicks are shipped O. O. D. Refusal to accept chicks or remit balance forfeits first payment. Remittance may be made as customer prefers, but all payments must be honored before shipment is made.

OLIVER FARM EQUIPMENT

OLIVER TRACTOR DISC HARROW

OLIVER TRACTOR DISC HARROW in 20-disc size is made for use with the small size tractor. It is controlled by the operator of the tractor and in this way requires only one man to operate both tractor and harrow. Built especially durable at each wearing point, easily operated and doing the best possible job of discing—that, in short, is the story of the construction, the operation and the work of the Oliver NTDH Harrow.

Oliver 8 Foot, 24 Tooth Rake

OLIVER SELF DUMP RAKE

THE OLIVER SELF DUMP RAKE is built with a strong rigid frame of hot riveted angle steel. A heavy truss rod runs the entire length of the frame and supports the center of the rake. It is a bridge trussed frame that is built to prevent sagging or twisting.

The rake teeth are lifted, and the hay dumped, by a pair of strong lift rods operating from each wheel. The ends of the lift rods are shaped into pawls to fit into the ratchets in the wheel hubs. The large number of ratchet teeth in the wheel hubs cause the rake to dump, the instant pressure is applied to the foot dump pedal. The rake teeth drop to the ground immediately, without leaving an unraked strip next to the windrow.

The teeth are made of heat treated high carbon spring steel. They are strong, but have sufficient springiness to prevent breakage when they encounter an obstruction.

The wheels are unusually strong. The concave tires are 1 3/4 inches wide and 54 inches in diameter.

Oliver Mower

OLIVER STALK CUTTER

OLIVER STALK CUTTER is steel built throughout with heavy angle steel frame and equipped with latest type steel wheel with dust-proof boxing, which makes it one of the strongest and most durable machines on the market, one that has had a thorough test under the most exacting conditions, thereby proving its worth.

Oliver 9 Blade Stalk Cutter

OLIVER MOWER

THE OLIVER MOWER is a fast-cutting, long-lasting machine, in which every part does its share.

The Oliver Mower Frame is strongly built and braced with a solid cross member to the pitman drive end, and braced back again to the tongue. This Big Frame holds the driving parts in rigid alignment and provides the solid base that allows the cutter bar the flexibility it needs, while holding it to its straight cutting line. The Oliver Frame is big, sturdy and solid. It will last and do its work, for many years to come.

In the big frame the full length solid axle runs in long roller bearings, spaced far apart, to give the lightest bearing load, which aids in securing the easiest draft.

All gear teeth of the spur gears, and also the bevel gears are correctly designed to mesh and secure the greatest power with the least loss to play and friction.

The clutch is of the four-jaw dog type, wide on its faces to keep down wear, positive and sure in action. It is controlled by a two pad, double acting foot lever that throws it quickly, either in or out.

No mower has any higher cutter bar speed than the Oliver—many are slower. This higher speed is very essential in cutting wild hay and especially so when mowing roadsides.
